The Wine Team Global AB

Hereby purchases 212 tonnes CO₂e taking responsibility for emissions arising from the life cycle emissions of projected sales from the Bergh product line in Sweden and Finland 25/26. The climate benefit is achieved through solar cookstoves in the project ADES Efficient Stoves in Madagascar

This project reduces emissions from deforestation by reducing the need for firewood as open fires for cooking are replaced with solar powered stoves. All stoves are produced on the island, providing an income for a variety of people. These stoves improve indoor air quality, and the preservation of the forests helps to conserve valuable biodiversity.
